## Acriglas® Custom Metallic Acrylic Sheets

Acriglas® Metallic acrylic sheets are designed to emulate the look of Bright dipped brushed anodized aluminum, or Powder Coated Metal. Unlike metal, this versatile product does not ding, crimp, or oxidize, and does not require a substrate or edge banding. Best of all, welding, riveting, and polishing become unnecessary, saving time, money, and effort.

## Applications

Acriglas® Metallics are ideal for:

- P.O.P. Displays • Lettering • Store Fixtures • Menu Boards
- Plaques • Lighting • Signs

## Availability

Acriglas® Metallics are currently offered in 12 standard colors and in thicknesses ranging from 1/8" – 1/2". Sheet sizes are limited to a nominal 4' x 4' (46" x 50" actual) in Brushed finish and 4' x 6' in Matte and textured finishes. Gloss finish sheets are available in 4' x 4', 4' x 5', and 4' x 6'.

## Custom Colors

Acriglas® Metallics are also available in any custom color. Because all Acriglas® products are made to order, lead times and minimum orders are the same whether standard or custom. Be creative and expand your choices by designing your own metallic product.

## Physical Properties

Acriglas® Metallics have the same physical properties as standard cell cast acrylic sheets. However, additional options for specific applications that require resistance to UV light, harsh chemicals, fragrances, etc. are available. Also, the composition of the sheets can be altered to ease thermoforming. This allows deeper draws than typical cell cast acrylic.

## Fabrication

Acriglas® Metallics can be cut, drilled, routed, laser cut, glued, formed, hot stamped, and silk screened like any other standard acrylic sheet. It is also ideal in applications that require other acrylic products to be used in combination with the Metallics without the need for mechanical fasteners or complex adhesives.

## Color Guarantees

While every effort is made to guarantee a perfect color match every time, variations in the metallic pigments may cause minor color variations in the finished sheet products of each production run. This is a normal characteristic of the Acriglas® Metallics and is not considered to be a defect. Therefore, care should be taken to avoid mixing products from separate production runs where accurate color matching is required.

## Important Note

The special process for manufacturing the Acriglas® Metallics can produce some slight pattern variations that are considered to be the nature of the material. Cell cast acrylic, by nature of the manufacturing process, will be subject to variations in thickness slightly beyond what is commonly experienced with extruded or continuous cast acrylic sheet. This is to be expected and is the nature of the material.

Due to printing processes, the colors on this brochure are representative, but are not exact matches of actual the acrylic products. Samples of actual product should be requested for approval prior to placing an order.
